How to prepare for the recruitment process?

1. Learn the basic programming paradigms: DataTypes, DataStructures, Control Structures, and how to use them.
2. Understand programming methodologies such as the greedy approach, and dynamic programming and where to apply them.
3. Understand the underlying Computer Architecture, how the computer network works, and the essentials of Kernel (Process/Memory/Disk/File Management).
4. You should be passionate about learning technologies and exploring them. Dockers/Kubernetes, System Design, etc., are some of the examples.

As part of the 2026 recruitment procedure, the initial stage of evaluation involves an online quiz, which candidates may register for and complete after submitting an application for a **job position** through our portal.

Those who pass the quiz are eligible to book a slot for the upcoming coding test and interviews.

Refer to the sample question papers in the “Resources” section in the talents portal to practice for the coding round. This round would have a maximum of 2 questions for 2-3 hours duration. Your coding style, logic, handling of edge cases, etc are taken into consideration.

Successful candidates would have 2 Technical Interviews and an HR interview. These interviews will be discussions, rather than a question-answer model, where we look forward to understanding each other. We look forward to ensuring that you are passionate and will land on the right career path. When the interview team and the candidate feel the same, you are a part of Electrifex.

About Electrifex

At Electrifex, we focus on the automotive domain and build products and services for our clients who belong to premium OEMs and Tier1s. Our Engineering department takes care of quality delivery of all our work promptly.

When looking to expand the department with new talents, we look forward to all means to interact with students and other working professionals who seek openings.

The in-vehicle ECU teams work closely with the Electronic Control Units and programs using C and Linux kernel know-how. We do not manufacture or design hardware but are pure programmers of the ECUs. On the other hand, the infrastructure team works on the middleware and focuses on developing CI-CD pipeline systems using Python/React. A good understanding of the underlying Operating Systems, Computer Networks, and architecture with a passion for programming is mandatory to work in the Engineering department. During the recruitment process, based on the candidates' skills that they exhibit, they get allocated to the respective divisions.
